

# Small *but* Dangerous?

Hi, I'm the Nanodetective. I'm on the hunt for a target within the body that may hold some important information. . . . .

The Nanodetective aims to find disease within the body; it could be a virus or a disease coding gene.

This information could help us prevent illness or find cures. As it is on the nanoscale, it is more selective and specific. Could we use this technology to screen people for their viability as employees, potential as life partners or even cherry pick our babies?

Or are we making a macromountain out of a nanohill?
